

Bayesian Metric Learning for Uncertainty Quantification in Image Retrieval

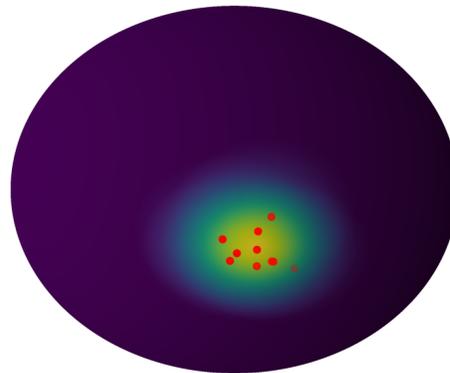

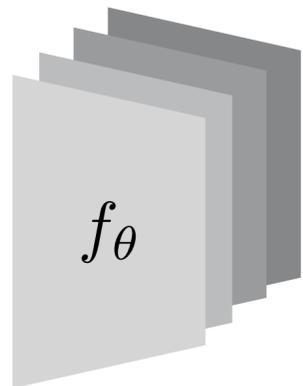

Frederik Warburg*, Marco Miani*, Silas Brack, Søren Hauberg

Technical University of Denmark

Laplacian Metric Lerner (LAM)

$$f_{\theta} : \mathbb{R}^{HWC} \longrightarrow \mathcal{S}^Z$$

$$\theta \sim \mathcal{N}(\theta_t, H_{\theta_t}^{-1})$$

is a network parametrised by $\theta \in \Theta$

Laplace Approximation

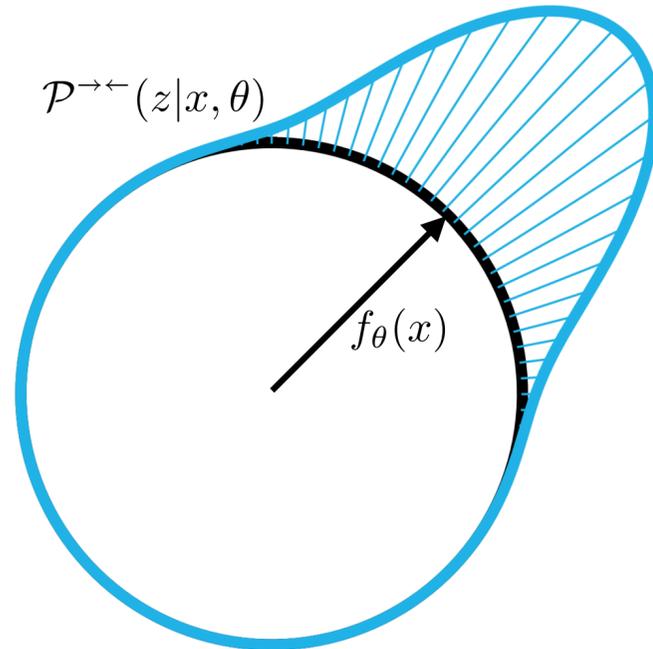

(Feasible thanks to *nnj* library)

Contrastive Loss

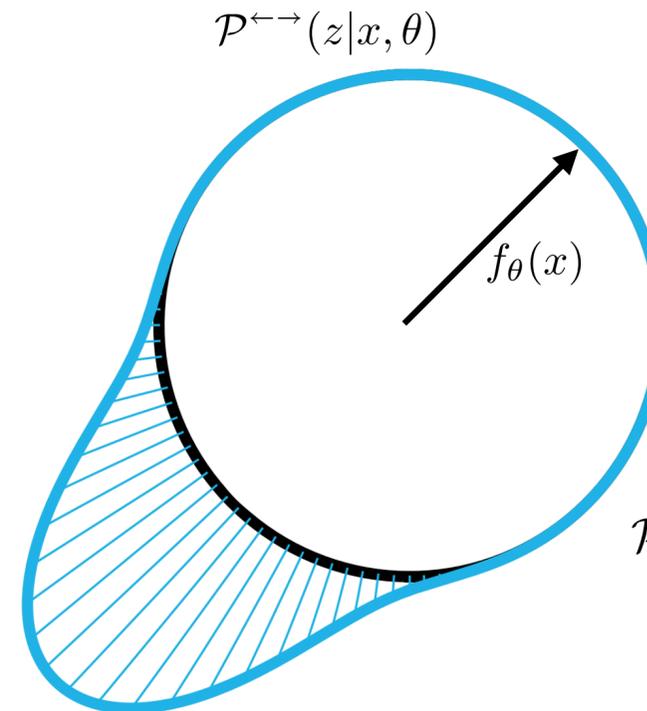

$$\mathcal{L}_{\text{con}}(\theta) = \frac{1}{2} \|f_{\theta}(x_a) - f_{\theta}(x_p)\|^2 + \frac{1}{2} \max(0, m - \|f_{\theta}(x_a) - f_{\theta}(x_n)\|^2)$$

attractive term

repulsive term

$$\mathcal{P}^{\rightarrow\leftarrow}(z|x, \theta) = c_{\kappa} \exp\left(-\kappa \frac{\|z - f_{\theta}(x)\|^2}{2}\right)$$

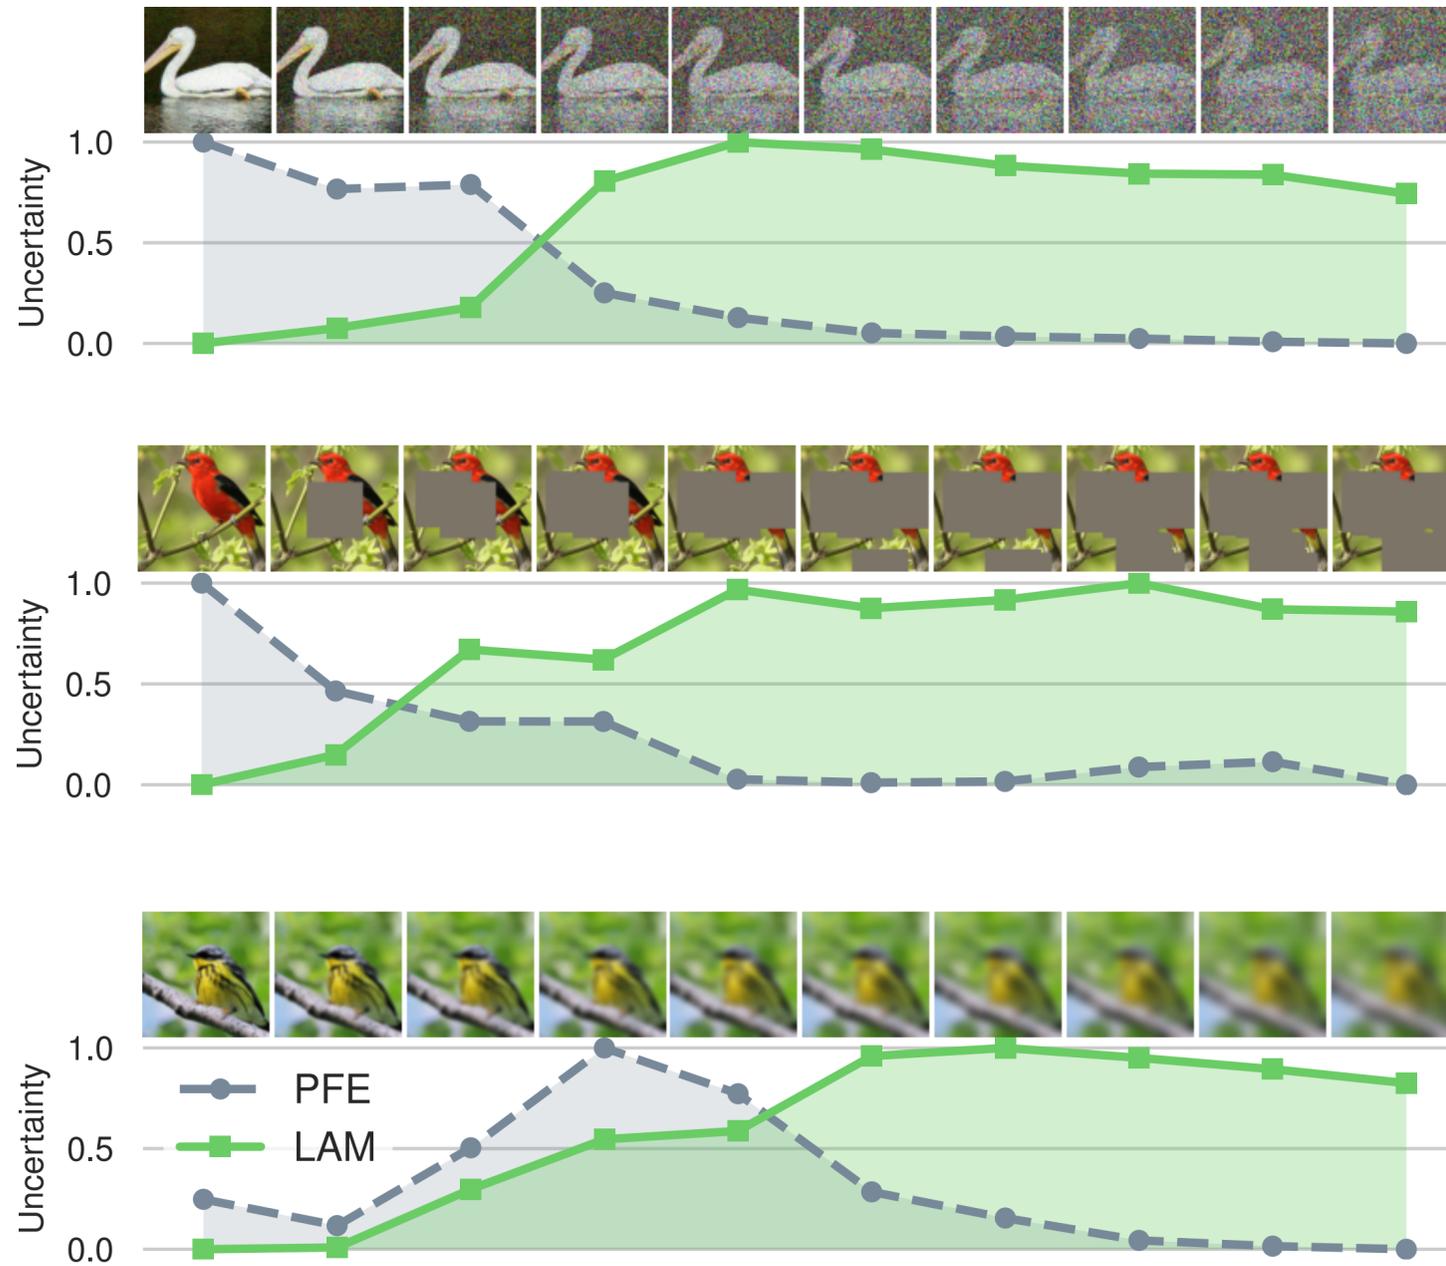

$$\mathcal{P}^{\leftarrow\rightarrow}(z|x, \theta) = c_{\kappa} \exp\left(-\kappa \frac{\|z + f_{\theta}(x)\|^2}{2}\right)$$

Proposition: The Contrastive loss is equal, up to an additive constant, to a negative log-likelihood

$$\log \mathcal{P}(\mathcal{D}|\theta) = -\mathcal{L}(\theta; \mathcal{D}) + c$$

Reliable stochastic embeddings

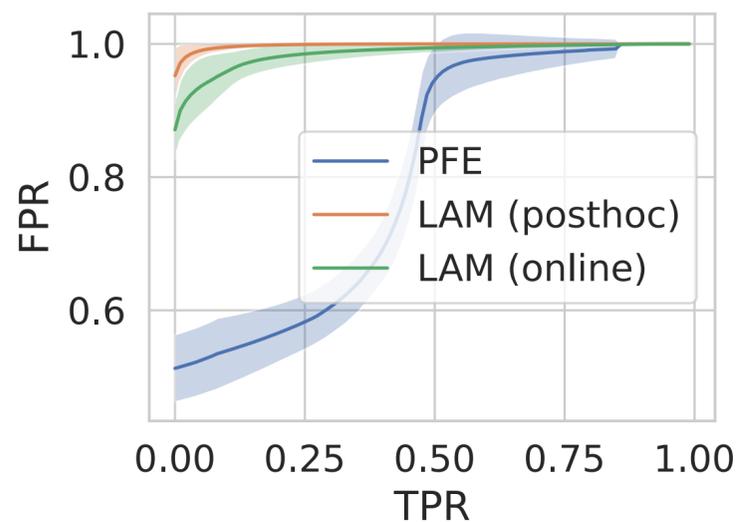

Embedding *uncertainty* for corrupted input image:

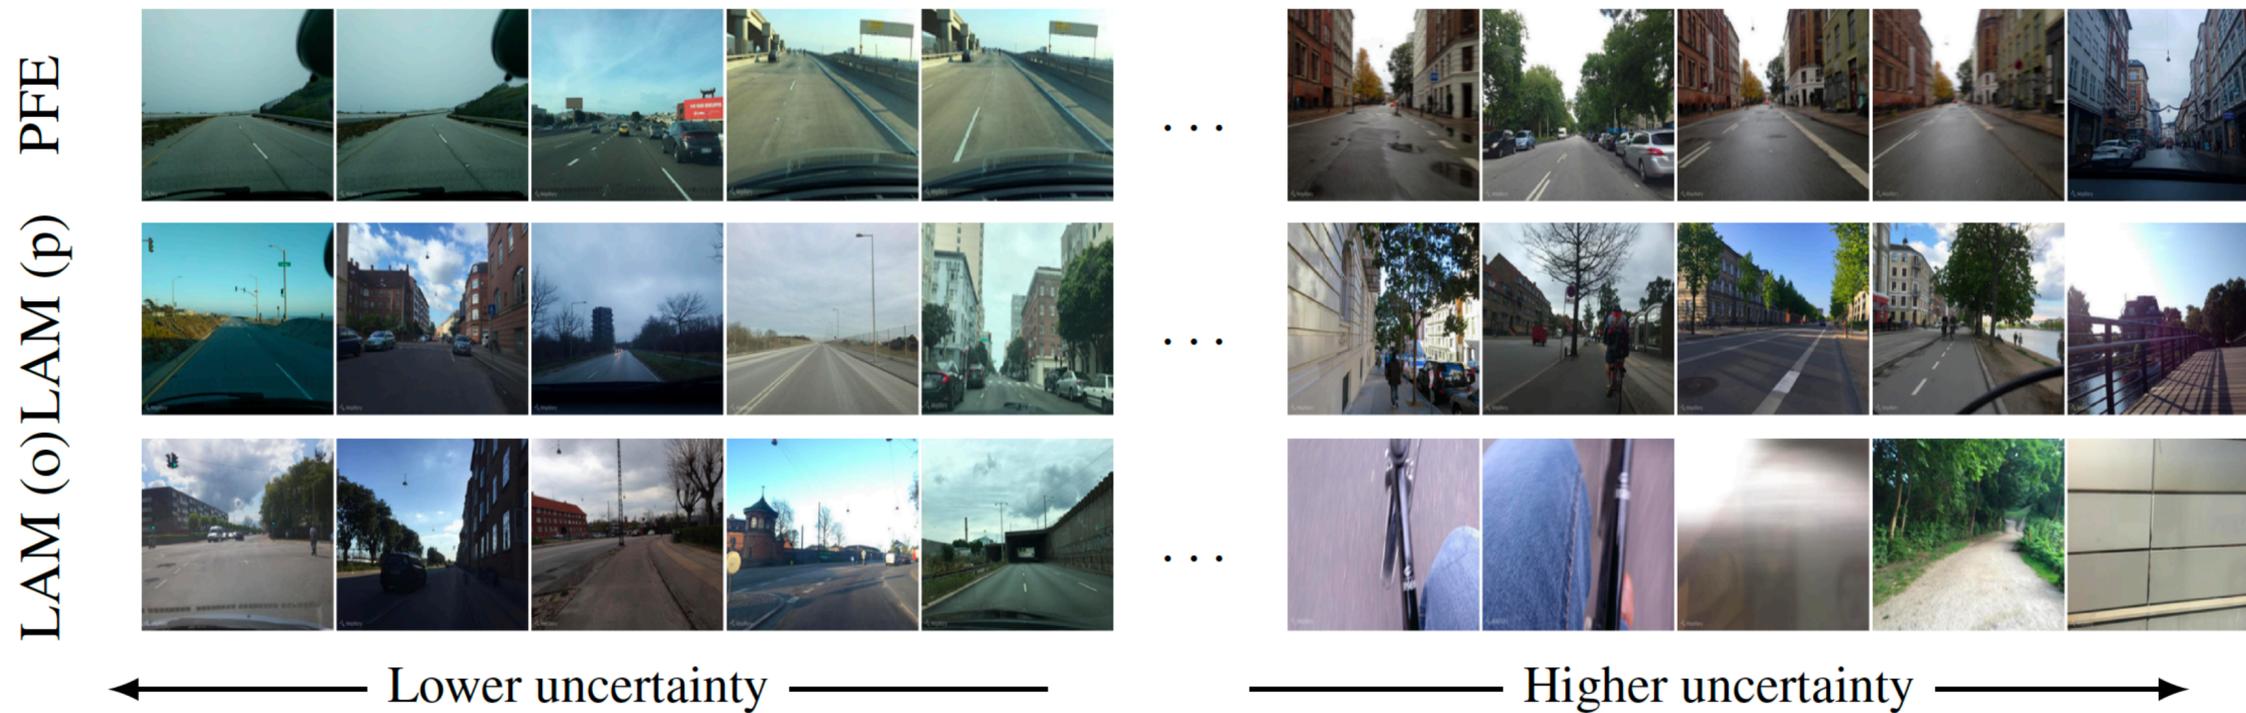

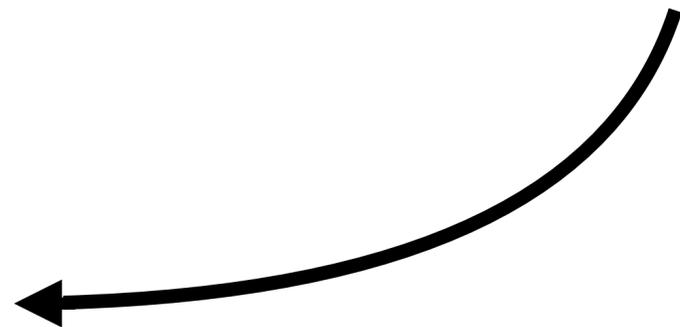

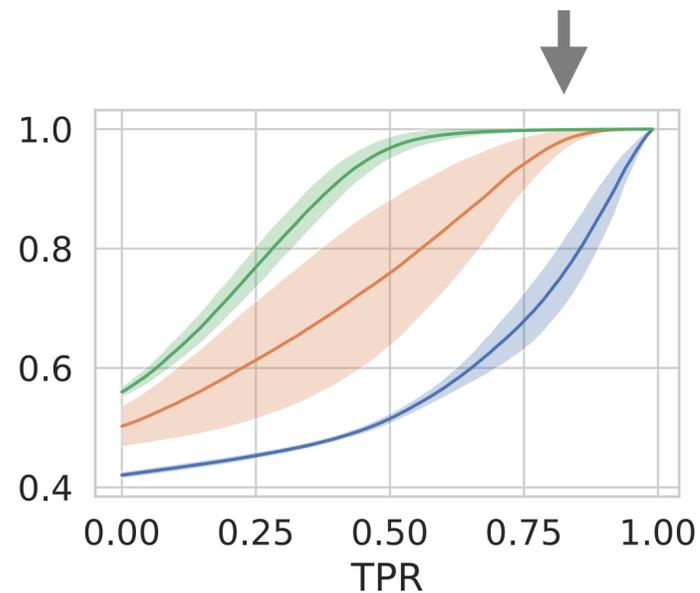

- noise
- occlusion
- blur

Out of Distribution detection

On out-of-distribution (**OoD**) data we measure the Area Under Receiver Operator Curve (AUROC), and Area Under Precision-Recall Curve (AUPRC)

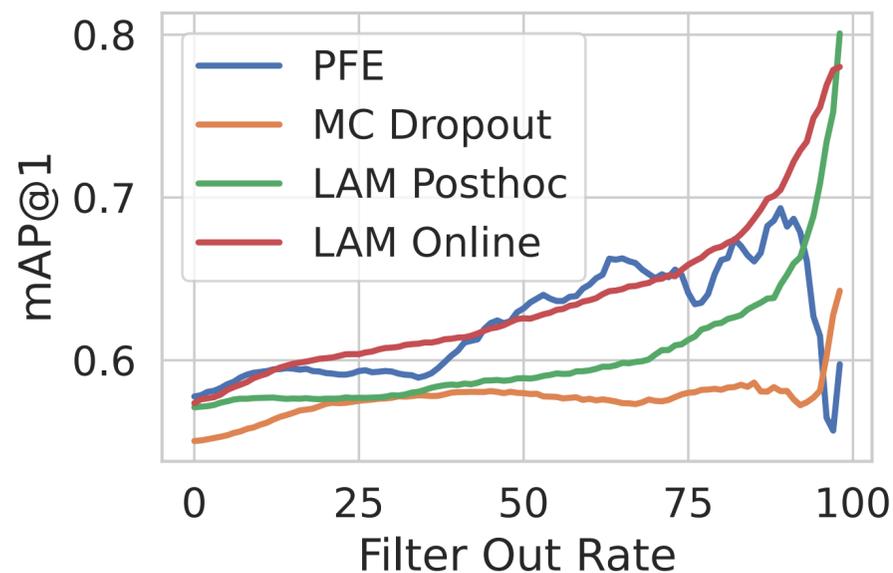

ROC on FashionMnist and Cifar-10

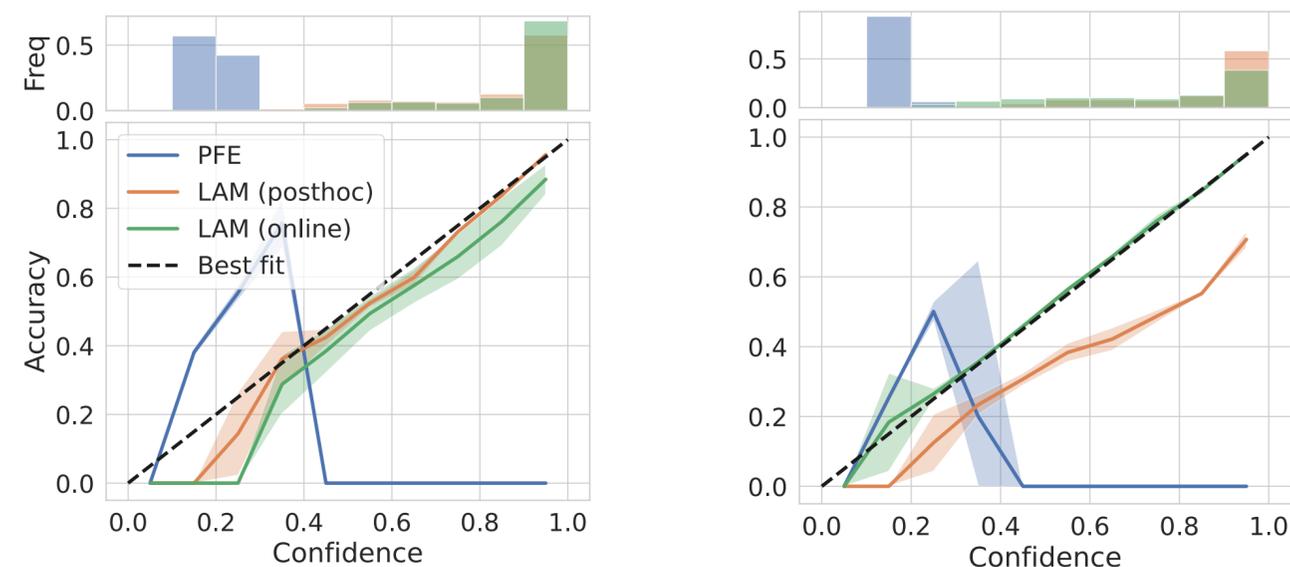

Calibrated Uncertainties

On in-distribution (ID) data we measure *Area Under the Sparsification Curve* (AUSC) and *Expected Calibration Error* (ECE)

Sparsification Curves on MSLS monotonically increase for LAM

Calibration Error on FashionMnist and Cifar-10, LAM is near-perfect
