

Distributed stochastic optimization

$$\min_{x \in \mathbb{R}^d} \left[f(x) := \frac{1}{n} \sum_{i=1}^n f_i(x) \right], \quad f_i(x) := \mathbb{E}_{\xi_i \sim \mathcal{D}_i} [f_i(x, \xi_i)]$$

- $f_i(\cdot)$ are nonconvex, • n is the number of nodes,
- \mathcal{D}_i are arbitrary distributions of data.

Goal: find x with $\mathbb{E} [\|\nabla f(x)\|] \leq \varepsilon$.

Assumptions

Assumption 1 (Lipschitz gradient). $f^* := \inf_{x \in \mathbb{R}^d} f(x) > -\infty$, $f(\cdot)$ and all $f_i(\cdot)$ have Lipschitz continuous gradient, i.e., $\forall x, y \in \mathbb{R}^d$ $\|\nabla f_i(x) - \nabla f_i(y)\| \leq L \|x - y\|$,

$$\|\nabla f_i(x) - \nabla f_i(y)\| \leq L_i \|x - y\|, \quad \tilde{L}^2 := \frac{1}{n} \sum_{i=1}^n L_i^2.$$

Assumption 2 (Bounded variance). Unbiased stochastic gradients: $\mathbb{E} [\nabla f_i(x, \xi_i)] = \nabla f_i(x)$. There exists $\sigma > 0$ such that

$$\mathbb{E} [\|\nabla f_i(x, \xi_i) - \nabla f_i(x)\|^2] \leq \sigma^2.$$

Contractive compressors

A map $\mathcal{C} : \mathbb{R}^d \rightarrow \mathbb{R}^d$ is a **contractive compressor** if $\exists \alpha \in (0, 1]$:

$$\mathbb{E} [\|\mathcal{C}(x) - x\|^2] \leq (1 - \alpha) \|x\|^2, \quad \forall x \in \mathbb{R}^d.$$

Example: **TopK (greedy)** sparsification keeps the $K \leq d$ largest entries of x in absolute value, and zeros out the rest. It is biased and **contractive** with $\alpha \geq \frac{K}{d}$.

Compressed gradient methods

Distributed first-order method

$$x^{t+1} = x^t - \frac{\gamma}{n} \sum_{i=1}^n g_i^t,$$

where $\gamma > 0$ is the step-size, and g_i^t is an **easy-to-communicate** (i.e., **compressed**) approximation of $\nabla f_i(x^t)$. How to construct g_i^t ?

1. Naive method: **Compressed SGD** $g_i^t = \mathcal{C}(\nabla f_i(x^t, \xi_i^t))$.

Advantages: • Conceptually easy.

Problem: • Diverges even for $\sigma = 0$ (if $n > 1$).

2. Error feedback (2014): EF14-SGD [1, 2]

$$\begin{aligned} e_i^{t+1} &= e_i^t + \gamma \nabla f_i(x^t, \xi_i^t) - g_i^t, \\ g_i^{t+1} &= \mathcal{C}(e_i^{t+1} + \gamma \nabla f_i(x^{t+1}, \xi_i^{t+1})). \end{aligned}$$

Advantages: • Converges (if \mathcal{D}_i are similar) [2].

Problems: • Not optimal even if $\sigma = 0$.
• Similarity of \mathcal{D}_i is needed for analysis.

3. Modern error feedback (2021): EF21-SGD [3, 4]

$$g_i^{t+1} = g_i^t + \mathcal{C}(\nabla f_i(x^{t+1}, \xi_i^{t+1}) - g_i^t).$$

Advantages: • Converges if $\sigma = 0$ [3].
• Optimal iteration complexity if $\sigma = 0$.

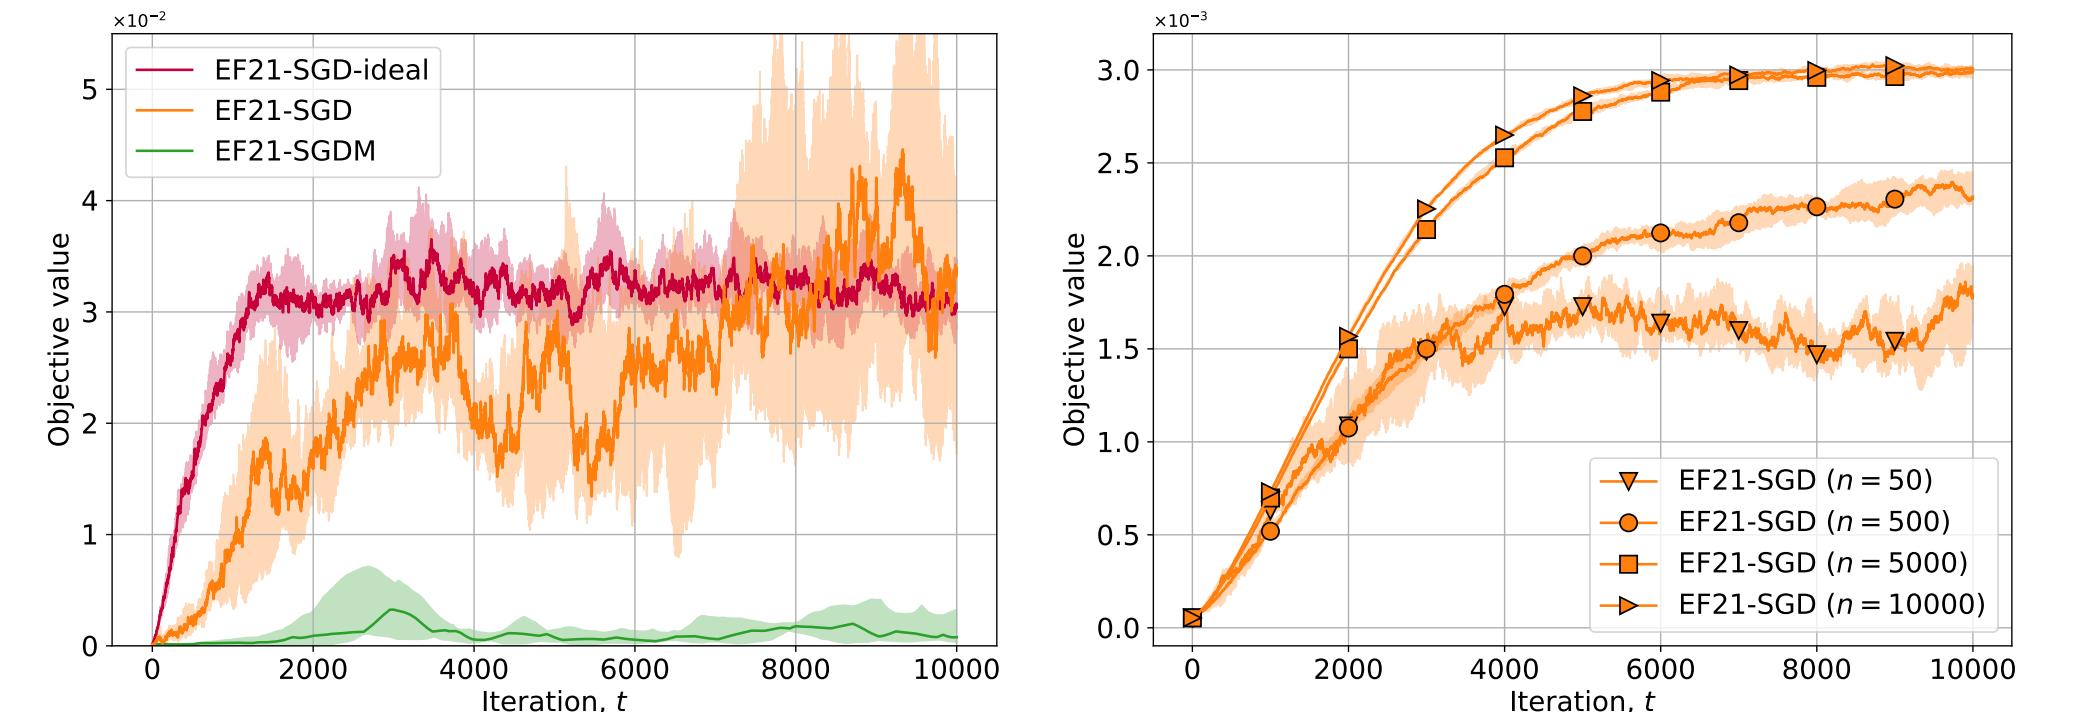

Problems: • Requires mega-batch: $B = \mathcal{O}(\frac{1}{\alpha^2 \varepsilon^2})$.
• Poor dependence on α .
• No improvement with n .

EF21 and stochastic gradients

Assume we know $\nabla f_i(x^{t+1})$. Replace g_i^t with $\nabla f_i(x^{t+1})$.

EF21-SGD-ideal: $g_i^{t+1} = \nabla f_i(x^{t+1}) + \mathcal{C}(\nabla f_i(x^{t+1}, \xi_i^{t+1}) - \nabla f_i(x^{t+1}))$.

Divergence of EF21-SGD and EF21-SGD-ideal on $f(x) = \frac{1}{2} \|x\|^2$.
No improvement when increasing n (right).

Divergence of EF21-SGD-ideal

Theorem 1. EF21-SGD-ideal may diverge for any $n \geq 1$:

$$\mathbb{E} [\|\nabla f(x^t)\|^2] \geq \frac{1}{60} \min \left\{ \sigma^2, \|\nabla f(x^0)\|^2 \right\}.$$

Conceptual fix

Apply damping of the noise with $\eta \in (0, 1)$. EF21-SGDM-ideal:

$$\begin{aligned} v_i^{t+1} &= \nabla f_i(x^{t+1}) + \eta (\nabla f_i(x^{t+1}, \xi_i^{t+1}) - \nabla f_i(x^{t+1})), \\ g_i^{t+1} &= \nabla f_i(x^{t+1}) + \mathcal{C}(v_i^{t+1} - \nabla f_i(x^{t+1})). \end{aligned}$$

Advantages:

- Fast convergence for small η .
- If $\eta = 0$, method recovers GD.

Problems:

- Not implementable without $\nabla f(x^{t+1})$.

Implementable method

Replace $\nabla f_i(x^{t+1})$ with v_i^t and $\nabla f_i(x^{t+1})$ with g_i^t . EF21-SGDM:

$$\begin{aligned} v_i^{t+1} &= v_i^t + \eta (\nabla f_i(x^{t+1}, \xi_i^{t+1}) - v_i^t), \\ g_i^{t+1} &= g_i^t + \mathcal{C}(v_i^{t+1} - g_i^t). \end{aligned}$$

Advantages:

- Easy to implement.
- Works with stochastic gradients.
- Fast convergence in theory and practice.

Algorithm 1: EF21-SGDM

Error Feedback 2021 Enhanced with Polyak Momentum

Input: $x^0, v_i^0, g_i^0 \in \mathbb{R}^d$; $\gamma > 0$; $\eta \in (0, 1]$, initial batch size B_{init}
for $t = 0, 1, \dots, T-1$ do

Master computes $x^{t+1} = x^t - \gamma g^t$ and broadcasts x^{t+1} to all nodes

for all nodes $i = 1, \dots, n$ in parallel do

 Compute momentum estimator

$$v_i^{t+1} = (1 - \eta) v_i^t + \eta \nabla f_i(x^{t+1}, \xi_i^{t+1})$$

 Compress $c_i^t = \mathcal{C}(v_i^{t+1} - g_i^t)$ and send c_i^t to the master
 Update local state $g_i^{t+1} = g_i^t + \mathcal{C}(v_i^{t+1} - g_i^t)$

end

Master computes $g^{t+1} = \frac{1}{n} \sum_{i=1}^n g_i^{t+1}$ via $g^{t+1} = g^t + \frac{1}{n} \sum_{i=1}^n c_i^t$

Summary of complexity results

Method	Communication complexity with TopK	Asymptotic sample complexity	No batch?	No extra assump.?
EF14-SGD [2]	$\frac{K \bar{G}}{\alpha \varepsilon^3}$	$\frac{\sigma^2}{n \varepsilon^4}$	✓	✗ ^(a)
NEOLITHIC	$\frac{K}{\alpha \varepsilon^2} \log \left(\frac{\bar{G}}{\varepsilon} \right)$	$\frac{\sigma^2}{n \varepsilon^4}$	✗	✗ ^(b)
EF21-SGD [4]	$\frac{K}{\alpha \varepsilon^2}$	$\frac{\sigma^2}{\alpha^3 \varepsilon^4}$	✗	✓
BEER	$\frac{K}{\alpha \varepsilon^2}$	$\frac{\sigma^2}{\alpha^2 \varepsilon^4}$	✗	✓
EF21-SGDM	$\frac{K}{\alpha \varepsilon^2}$	$\frac{\sigma^2}{n \varepsilon^4}$	✓	✓
EF21-SGD2M	$\frac{K}{\alpha \varepsilon^2}$	$\frac{\sigma^2}{n \varepsilon^4}$	✓	✓

(a) Extra assumption (BG): $\mathbb{E} [\|\nabla f_i(x, \xi_i)\|^2] \leq G^2$.

(b) Extra assumption (BGS) $\frac{1}{n} \sum_{i=1}^n \|\nabla f_i(x) - \nabla f(x)\|^2 \leq G^2$.

Convergence theory

Denote $\delta_t := f(x^t) - f^*$, $v^t := \frac{1}{n} \sum_{i=1}^n v_i^t$. The Lyapunov function is Λ_t :

$$\delta_t + \frac{\gamma}{\alpha n} \sum_{i=1}^n \|g_i^t - v_i^t\|^2 + \frac{\gamma \eta}{\alpha^2 n} \sum_{i=1}^n \|v_i^t - \nabla f_i(x^t)\|^2 + \frac{\gamma}{\eta} \|v^t - \nabla f(x^t)\|^2.$$

EF21-SGDM

Theorem 2. Under Assumptions 1, 2 and small enough step-size we have for EF21-SGDM

$$\mathbb{E} [\|\nabla f(x^T)\|^2] = \mathcal{O} \left(\frac{\Lambda_0}{\gamma T} + \frac{\eta^3 \sigma^2}{\alpha^2} + \frac{\eta^2 \sigma^2}{\alpha} + \frac{\eta \sigma^2}{n} \right).$$

Choosing appropriate γ , η and B_{init} , we have for the RHS

$$\mathcal{O} \left(\frac{\tilde{L} \delta_0}{\alpha T} + \left(\frac{L \delta_0 \sigma^{2/3}}{\alpha^{2/3} T} \right)^{3/4} + \left(\frac{L \delta_0 \sigma}{\sqrt{\alpha} T} \right)^{2/3} + \left(\frac{L \delta_0 \sigma^2}{n T} \right)^{1/2} \right).$$

The sample complexity:

$$\#\text{grad} = T = \mathcal{O} \left(\frac{\tilde{L}}{\alpha \varepsilon^2} + \frac{L \sigma^{2/3}}{\alpha^{2/3} \varepsilon^{8/3}} + \frac{L \sigma}{\alpha^{1/2} \varepsilon^3} + \frac{L \sigma^2}{n \varepsilon^4} \right).$$

Advantages:

- Better than EF14-SGD: $\#\text{grad} = \mathcal{O} \left(\frac{G}{\alpha \varepsilon^3} + \frac{\sigma^2}{n \varepsilon^4} \right)$.
- Better than EF21-SGD: $\#\text{grad} = \mathcal{O} \left(\frac{1}{\alpha \varepsilon^2} + \frac{\sigma^2}{\alpha^3 \varepsilon^4} \right)$.
- Weaker assumptions than for EF14-SGD, and batch-free!
- Optimal communication complexity when used with $B \geq 1$.
- Asymptotically optimal sample complexity ($\varepsilon \rightarrow 0$).

Further improvement with double momentum!

Use momentum twice before compression. EF21-SGD2M:

$$\begin{aligned} v_i^{t+1} &= (1 - \eta) v_i^t + \eta \nabla f_i(x^{t+1}, \xi_i^{t+1}), \\ u_i^{t+1} &= (1 - \eta) u_i^t + \eta v_i^{t+1}, \\ g_i^{t+1} &= g_i^t + \mathcal{C}(u_i^{t+1} - g_i^t). \end{aligned}$$

EF21-SGD2M

Theorem 3. The sample complexity of EF21-SGD2M:

$$T = \mathcal{O} \left(\frac{\tilde{L}}{\alpha \varepsilon^2} + \frac{L \sigma^{2/3}}{\alpha^{2/3} \varepsilon^{8/3}} + \frac{L \sigma^2}{n \varepsilon^4} \right).$$

Experiments

Logistic regression problem with a **non-convex** regularizer,

$$f_i(x_1, \dots, x_c) = -\frac{1}{m} \sum_{j=1}^m \log \left(\frac{\exp(a_{ij}^\top x_{ij})}{\sum_{y=1}^c \exp(a_{ij}^\top x_y)} \right) + \lambda \sum_{y=1}^c \sum_{k=1}^l \frac{|x_{yk}|_k^2}{1 + |x_{yk}|_k^2},$$

where $\lambda > 0$, $x_1, \dots, x_c \in \mathbb{R}^l$, $[.]_k$ is an indexing operation of a vector, $c \geq 2$ is the number of classes, l is the number of features, m is the size of a dataset, $a_{ij} \in \mathbb{R}^l$ and $y_{ij} \in \{1, \dots, c\}$ are features and labels
